PREFACE

An attempt has been made in this brochure to compile useful demographic data in regard to cities and town-groups which had a population of 100,000 and over in the 1961 Census. Restricted space has prevented the inclusion of a variety of other relevant data, but what is contained here provides a reasonably satisfactory picture of the urban centres covered and brings out their distinctive character. It is hoped that urban local governments will find the information useful not only for comparative purposes but also for planning municipal activities rationally. Most urban areas in India carry a back-log of varying dimensions in regard to services, utilities and amenities. For proper planning on a rational basis, demographic data is of crucial importance. Whether it be in the field of water-supply or provision of educational facilities or parks and open spaces or medical relief or housing, a general idea of the nature of the human content of the urban area is essential. Furthermore, for planning progressive development of municipal activities with a view to enriching the town economically, some idea of the occupation pattern of the population is necessary. Within its limited scope, this brochure provides some of the basic data for such purposes. A brief bibliography has also been provided in the brochure. For all those interested in a more detailed study, these reference books are likely to prove useful. It is needless to add that the census reports contain a fund of valuable information on various aspects of the urban situation in India.

The Centre for Training and Research in Municipal Administration is not only concerned with imparting training to senior and middle level municipal employees but is also interested in disseminating useful information on subjects relevant to city government and in arousing interest in urban problems. This publication is a modest attempt in that direction. Equally, the Centre would welcome suggestions from urban local bodies about the manner in which it can help them and to receive information from them about their cities—all is grist that comes to its mill.

Shri P.V. Rao, Statistician and Miss Shanta Kohli, Research Assistant, in this Centre have been mainly responsible for this compilation. Our thanks are also due to the Town and Country Planning Organisation of the Ministry of Health, Family Planning and Urban Development of the Government of India, in particular to Shri Shri Manohar, Architect Planner of that Organisation, for the cover design.

November 1968

INTRODUCTION

As has already been stated in the Preface, this publication deals with some aspects only of the demographic position of the larger towns. The information contained in the statistical tables pertains to area, growth of population in absolute terms during the decade 1951-61, and the rate of growth during this period. In addition, figures about the density of population in 1961 have also been incorporated as these provide a very important index to the character of urban growth. Information has also been given about the occupation pattern of the population of these towns, because a change in the pattern is indicative of a change in the urban characteristic.

In order to provide a summarised picture of the housing pattern, data in regard to housing has also been included.

Lastly, information regarding the revenue and expenditure of the cities, except for a few where information was not available, has also been included.

It is obvious that statistical data on these important matters can be purposefully utilised only if observations are made over a reasonably long period of time so that any unusual variations or fluctuations are taken note of and, where necessary, remedial measures adopted. These measures may be required both in the physical and economic spheres. For instance, a sudden fall in the rate of growth of population of the town may call for urgent investigation both of birth and mortality rates and changes in the migration pattern as well as of the general "health" of the city. Similarly, the occupation pattern of the town needs to be carefully watched over a period of time, as it will indicate whether the town was becoming economically stronger or not. Other more complicated and sophisticated postures are possible, but within the scope of this preliminary publication, it has not been possible to deal with them. Yet, it is felt that even elementary information about towns will prove worthwhile to planners, politicians and administrators.

(1) Area

There were 65 cities and 48 town groups which had a population of one lac and above according to 1961 census. Out of the 65 cities and 48 town groups, the information about the area was not available for three cities. The total area for the 62 cities was 992.46 square miles and for the 48 town groups 1,708.12 square miles.

Among the cities, Baranagar had the smallest area (2.74 sq. miles) while Greater Bombay had the highest area (169.00 sq. miles). Coming to the town groups, Moradabad had the smallest area (4.50 sq. miles) while Bangalore had the biggest area (193.52 sq. miles).

(2) Population Growth

The study of urban growth rates based on the 1961 Census presents special problems because this census adopted a new definition of "urban" which was uniformly applied in all the States of India. This definition was more rigorous than the earlier definitions. As a result, 857 towns of 1951 Census were declassified in 1961. However, 497 new towns were added to the list of towns in 1961.

A study of census figures for 1951 and 1961 reveals an unprecedented growth of towns and cities in India. The total population of the 65 cities increased from 15,813,018 in 1951 to 20,127,355 in 1961 which shows a total increase of 4,314,337 during this decade i.e., +27.28 decade percentage rate of growth while the total population of 48 town groups increased from 12,957,103 in 1951 to 18,049,552 in 1961 which shows an increase of 5,092,449 i.e., +39.30 decade percentage rate of growth. The total population of the 65 cities and 48 town groups increased from 28,770,121 in 1951 to 38,176,907 in 1961 which shows a total increase of 9,406,786 i.e., +32.70 decade percentage rate of growth.

Out of the 65 cities, Kolar Gold Fields was the only city which showed a negative percentage decade rate of growth (—7.71), while Rampur and Gauhati had the minimum (0.84) and maximum (130.90) positive percentage decade rates of growth respectively. Among the town groups, Dehradun and Durg showed the minimum (+8.41) and maximum (+557.96) percentage decade rates of growth respectively.

There were 30 cities which had less than the average percentage decade rate of growth (+27.28) while 35 were above. In the case of town groups, the average percentage decade rate of growth was +39.30 and 28 town groups were below this average and 20 town groups were above.

(3) Population Density

In dealing with the subject of population density, one of the greatest sources of confusion is the lack of clear definition of terms used. For example, the density will be higher if parks, commercial and industrial sections are omitted and it will be still higher if occupied residential lots alone are considered. But the density will be less if we consider the total area of a city or town.

According to the 1961 Census, among the 62 cities for which the information about density was available, Surat (90,290 persons per sq. mile) had the highest density followed by Calcutta (73,550 persons per sq. mile); while Kota (1,610 persons per sq. mile) had the lowest density followed by Kolar Gold Fields (4,894 persons per sq. mile).

In the case of town groups, Moradabad (42,628 persons per sq. mile) had the highest density followed by Belgaum (27,183 persons per sq. mile) while Durg (2,784 persons per sq. mile) had the lowest density followed by Kurichi (2,843 persons per sq. mile).

More revealing comparisons are possible if we look at densities in specific sections of cities. For example, according to the 1951 Census the density in Old Delhi was 136,536 persons per square mile, whereas the corresponding density in New Delhi was 8,419 persons per square mile. The vast compression of human beings in small spaces becomes even clearer if we consider that in three of the 18 wards of Old Delhi, densities over 400,000 persons per square mile were observed, and that another four wards showed densities of over 275,000 persons per square mile. Only five wards out of the 18 had densities of less than 100,000 persons per square mile.¹ Similar ranges in density and similar peak densities are reported also from other cities, e.g., Aligarh and Bombay. In the latter city the lowest densities are found in Upper Colaba with 14,528 persons per square mile in 1951, the highest densities are found in the Bhuleshwar section of C ward with 873,984 persons per square mile.² At Aligarh, the differences in density, though substantial, are somewhat less; in 1951 they ranged from 4,928 persons per square mile in the Civil Lines to 136,384 persons per square mile in Kanwariganj ward.³

(4) Occupation Patterns

The provision of employment is a major objective of planning and expansion of job opportunities commensurate with the increase in labour force has been conceived as one of the principal aims of both the Second and Third Five Year Plans.

The industrial categories in 1961 Census were as follows :

- (1) Cultivator
- (2) Agricultural labour
- (3) Mining, quarrying, live-stock, forestry, etc.
- (4) Household Industry
- (5) Manufacturing other than household industry
- (6) Construction
- (7) Trade and Commerce

¹ Delhi Development Authority, Draft Master Plan for Delhi (Delhi : D.D.A., 1960).

³ Howard F. Hirt, "Spatial Aspects of the Housing Problem in Aligarh, U.P., India", *Population Review*, 11, No. 1 (January, 1960).

- (8) Transport, storage and communication
- (9) Other services

For the limited purpose of our analysis here, we have taken the fifth one, namely Manufacturing other than household industry. This gives us a rough idea of the extent to which a city or town group is industrially advanced and advancing. The total number of workers for the 65 cities in all the nine categories of industries was 6,938,682 and for the 48 town groups was 5,700,738. This gives an average of 106,749 and 118,765 workers for a city and town group respectively. The percentage of workers to the total population was 34.47 in the case of cities and 31.58 in the case of town groups. Out of the 65 cities, 56 had less and 9 more than the average number of workers. As regards town groups, 35 of the 48 had less and 13 more than the average number of workers. It will be seen from the table that Akola contained the smallest percentage (25.76) and Gauhati the highest percentage (42.24) of workers followed by Bally (42.06), while in the case of town groups, Agra had the smallest (27.23) and Durg the highest (50.78) percentage of workers followed by Dhanbad-Jharia-Sindri (41.87). The next census is likely to give some indication about progress in industrialisation in respect of these cities and town groups.

Coming to the workers in manufacturing other than household industry, it will be observed that Kolar Gold Fields contained the smallest (2.73) and Bhatpara the highest (70.77) percentage of workers; while in the case of town groups, Shillong had the smallest (6.65) and Jamshedpur the highest (53.00) percentage of workers followed by Ahmedabad (49.77). The combined percentage of workers for both cities and town groups in industry other than household industry to the total workers was 27.44.

The occupational distribution of the population of the different sized towns shows significant variations. The larger the city, the smaller is the proportion of its population dependent on agriculture and primary industry.

(5) Houses and Households

The rapid growth of urban population has created a number of social and economic problems. Unemployment and under-employment in cities is high. Housing, water supply and sanitation services are comparatively deficient and slums abound. The National Sample Survey (7th round, 1953-54) has given the following figures with regard to the housing conditions in our cities as compared to the villages :

(a) Families living in one room or less :

			Per cent
Rural	34
Urban	44
In four big cities	67
In Calcutta	79

(b) Households with per capita floor area of less than 50 square feet :

			Per cent
Rural	14
Urban	21
In four biggest cities in India	33
In Calcutta	70

The distinction between a house and a household has been indicated in the definition. Thus, there may be one or more households in a census house.

In all the 65 cities there were 3,371,956 census houses and 3,956,896 census households.

(6) Revenue and Expenditure

After Independence two Committees viz., Local Finance Enquiry Committee 1949 and the Taxation Enquiry Commission 1953 examined the problems of finances of urban local bodies. The Local Finance Enquiry Committee was constituted in 1949 to enquire into the question of finances of local bodies and to make recommendations for the improvement of local finances. The Committee examined the finances of municipal corporations and municipalities in detail and made comprehensive recommendations for improving

their finances. In the year 1953, the Taxation Enquiry Commission again went into the finances of municipal corporations and municipalities as a part of the study of overall taxation, at various levels of Government *i.e.*, Central, State and Local. It also made some important recommendations concerning taxation in local bodies.

Again another Committee of Ministers was constituted by the Central Council of Local Self-Government in the year 1963 to study the problem of augmentation of the financial resources of the local bodies in all its aspects. The data on revenue and expenditure were taken from this report for the year 1960-61 for the purpose of this analysis.

Out of the 65 cities and 48 town groups, revenue figures were not available for 11 cities and 7 town groups. Similarly, expenditure figures were not available for 13 cities and 7 town groups.

In calculating the per capita revenue and expenditure of the local body in the case of town groups, the population of the main town of the town group was taken into account because the income and expenditure figures were available for that main town only and not for the entire town group. The average per capita income of the 41 main towns of the town groups was Rs. 24.15. Sangli municipality had the highest per capita income (Rs. 67.85) while South Suburban had the lowest per capita income (Rs. 5.26). Twenty-nine towns out of the 41 town groups had less than the average per capita income while the remaining 12 had more.

Coming to the cities, the per capita income was the highest (Rs. 54.74) in the case of Malegaon municipality followed by Akola (Rs. 49.39), while Kharagpur had the lowest per capita income (Rs. 1.78). The average per capita income of the 54 cities for which the data were available was Rs. 25.59 per annum. Forty cities out of the 54 cities had less than the average per capita income while the remaining 14 cities had more.

The combined average per capita income for the 54 cities and 41 towns was calculated to be Rs. 24.98.

Coming to the item of expenditure, the average per capita expenditure for the 52 cities for which the data were available was Rs. 24.83. Thirty-nine cities had less than the average per capita expenditure while the remaining 13 had more. Nellore had the highest per capita expenditure (Rs. 49.48) followed by Rajkot (Rs. 47.13), while Bikaner (Rs. 1.77) had the lowest per capita expenditure.

In the case of town groups, the average per capita expenditure for the 41 main towns of the town groups for which the data were available was Rs. 24.56. Thirty-two towns had less than the average per capita expenditure while the remaining 9 had more. Hubli-Dharwar (Rs. 46.01) had the highest per capita expenditure, while South Suburban (Rs. 5.05) had the lowest.

TABLE

Table showing area, density, rate of growth, total number of workers, workers in manufacturing, total income and per capita income, total expenditure and per capita expenditure

S. No.	Name of the city	Area in sq. miles	Population 1951	Population 1961	Density per sq. mile 1961	% decade rate of growth during 1951-61	Total number of workers

APPENDICES

APPENDIX I

The following definitions were taken from the Census of India Publications, 1961 :

(1) Area :

Area figures are furnished either by the Surveyor General of India or by the State Survey Department. The urban areas are based on the area of individual towns furnished by the Local Authorities.

(Census of India, 1961 ; Vol. I, Part II-A (i)—page 69.)

(2) Population :

Total number of people irrespective of age and sex.

(3) Workers :

The following was adopted as the basis of work :

In the case of seasonal work like cultivation, livestock, dairying, etc., if a person had some regular work of more than one hour a day throughout the greater part of the working season he was to be regarded as a "worker". In the case of regular employment in any trade, profession, service, business or commerce, the basis of work would be satisfied if the person was employed during any of the fifteen days preceding the day on which he was enumerated. (Census of India, 1961 ; Vol. I, Part II-B (i)—page 2.)

(4) Manufacturing other than household industry :

Manufacturing includes all types of production, processing, servicing or repairing of goods, which is not done in household industry. (Census of India, 1961 ; Vol. I, Part II-B (i)—page 3.)

(5) Houses :

A census house is a structure or part of a structure inhabited or vacant, or a dwelling, a shop, a shop-cum-dwelling or a place of business, workshop, school, etc., with separate entrance. (Census of India, 1961; Vol. I, Part II-A (ii)—page II.)

(6) Household :

A household is a group of persons who commonly live together and would take their meals from a common kitchen unless the exigencies of work prevented any of them from doing so. There may be one or more households in a census house. (Census of India, 1961; Vol. I, Part II-A (ii)—page II.)

APPENDIX II

The following definitions were taken from the Report of the Committee of Ministers on "Augmentation of Financial Resources of Urban Local Bodies, 1963".

(1) Income :

Total income of an urban local body includes the following items :

(a) Ordinary income (Tax income)

- (1) Octroi tax
- (2) Terminal tax
- (3) Taxes on houses and lands
- (4) Tax on vehicles and animals
- (5) Tax on profession and trades
- (6) Toll tax
- (7) Service tax
- (8) Education tax

- (9) Pilgrim tax
- (10) Theatre tax
- (11) Hotel tax
- (12) Other taxes
- (b) Ordinary income :
 - (1) Fees and fines
 - (2) Rents and prices
 - (3) Grants and contributions
 - (4) Miscellaneous
- (c) Extraordinary income :
 - (1) Loans
- (2) **Expenditure :**

Total expenditure includes the following items :

 - (a) Ordinary expenditure :
 - (1) General Administration
 - (2) Collection of Revenues
 - (3) Public Health
 - (4) Public safety and convenience
 - (5) Education
 - (6) Public Works
 - (7) Miscellaneous
 - (b) Extraordinary expenditure :
 - (1) Repayment of loans
 - (2) Capital expenditure
 - (3) Miscellaneous extraordinary expenditure.

APPENDIX III

(1) Density :

Density is obtained by dividing the total population of the city or town-group by the area of that city or town group respectively

$$\text{Density} = \frac{\text{Population}}{\text{Area}}$$

(2) Decade percentage rate of growth :

$$\text{Decade percentage rate of growth} = \frac{\text{Population in 1961} - \text{Population in 1951}}{\text{Population in 1951}} \times 100$$

(3) Per capita Income of urban local body :

It is obtained by dividing the total income of the local body by the total population.

(4) Per capita Expenditure of urban local body :

It is obtained by dividing the total expenditure by the total population.
